

virtual  vehicle

VIRTUAL VEHICLE is a leading international R&D center for the automotive and rail industries. The center focuses on advanced virtualization of vehicle development. This linking of numerical simulations and hardware testing leads to a powerful HW-SW system design. About 300 people are now employed at our site in Graz - their expertise enables the efficient development of affordable, safe and environmentally friendly vehicles.

Master Thesis

“Detection of injuries with long-term consequences in road accidents using human models”

Ref.Nr. R_021

Bachelor-/Master Thesis

As an alternative to conventional crash test dummies, so-called human body models are increasingly becoming the focus of developments in the field of vehicle safety. These FE models have an anatomically detailed structure and therefore enable a more comprehensive evaluation of injury mechanisms for a more diverse group of vehicle occupants. In an ongoing international research project, methods are to be developed using FE human models to predict the probability of injuries with long-term consequences. Bachelor's and Master's theses are possible from this project, depending on interest.

Your Tasks

- Familiarisation with the topic / literature research.
- Carrying out FE simulations with human models.
- Interpretation of results / documentation.

What we expect from you

- Technical studies.
- Interest in modelling and simulation.

What we offer

- Introduction to the tools for FE simulation.
- Work on a current international research project.
- Support from a dedicated team.
- Interesting work in an internationally active research center.
- Paid diploma thesis.
- Mentoring program for new employees'.
- Diverse sports and health activities regularly.
- Corporate Events.
